

Modular Arithmetic & GCD

Agenda:

- * Modular Arithmetic Introduction
- * Count pairs whose sum mod m is 0
- * Introduction to GCD
- * Properties of GCD
- * Delete One.

Modulo : (%)

$A \% B \rightarrow$ Remainder When A is divided by B.

$$10 \% 4 = 2$$

$$13 \% 5 = 3$$

$$\begin{array}{r} 8 \\ \text{divisor} \quad \xrightarrow{\quad} \quad \text{dividend} \\ 9) 75 \\ - 72 \\ \hline 3 \end{array}$$

Quotient Dividend
Divisor Remainder

$$\text{dividend} = \text{divisor} * \text{quotient} + \text{Remainder}$$

Reminder = dividend - divisor \times quotient .
 greatest mult of
 divisor \leq dividend .

$$23 \div 5$$

$$\text{dividend} = \text{divisor} \times \text{quotient} + \text{rem}$$

$$23 = 5 * 4 + 3$$

$$10 \div 4 = 10 - (\text{largest multiple of } 4 \leq 10)$$

$$= 10 - 8$$

$$= 2$$

$$13 \div 5 = 13 - (\text{largest multiple of } 5 \leq 13)$$

$$= 13 - 10$$

$$= 3$$

Why % is important: limit the range of date.

Range of $A \% B \rightarrow [0, B-1]$

$$\begin{array}{lll} 1 \% 5 \rightarrow 1 & 4 \% 5 \rightarrow 4 & 7 \% 5 \rightarrow 2 \\ 2 \% 5 \rightarrow 2 & 5 \% 5 \rightarrow 0 & 8 \% 5 \rightarrow 3 \\ 3 \% 5 \rightarrow 3 & 6 \% 5 \rightarrow 1 & 9 \% 5 \rightarrow 4 \end{array}$$

Modular Arithmetic Rules:

$$1) (a+b)\%m = (a \% m + b \% m)\%m$$

$$\text{Eg. } a=9, b=8, m=5$$

$$\begin{aligned} \Rightarrow (9+8)\%5 &= (9 \% 5 + 8 \% 5)\%5 \\ \Rightarrow (17)\%5 &= (4 + 3)\%5 \\ \Rightarrow 2 &= 7 \% 5 \\ &= 2 \end{aligned}$$

$$2) (a * b)\% \cdot m = (a\% \cdot m * b\% \cdot m)\% \cdot m$$

Eg. $a=4$ $b=5$ $m=7$

$$\Rightarrow (4 * 5)\% \cdot 7 = (4\% \cdot 7 * 5\% \cdot 7)\% \cdot 7$$
$$\Rightarrow 20\% \cdot 7 = (4 * 5)\% \cdot 7$$
$$\Rightarrow 6 = 6$$

$$3) (a + m)\% \cdot m$$

$$\begin{aligned} &= (a\% \cdot m + m\% \cdot m)\% \cdot m \\ &= (a\% \cdot m + 0)\% \cdot m \\ &= (a\% \cdot m)\% \cdot m \\ &= a\% \cdot m \end{aligned}$$

$$4) a\% \cdot m = (a + m)\% \cdot m$$

$$5) (a - b)\% \cdot m = (a\% \cdot m - b\% \cdot m + m)\% \cdot m$$

To adjust negative remainder

$$\text{Eg. } a = 7 \quad b = 10 \quad m = 5$$

$$(a - b) \% m = (a \% m - b \% m) \% m$$

$$\Rightarrow (7 - 10) \% 5$$

$$\Rightarrow -3 \% 5$$

$a \% m$ ↙
 \downarrow
 $(a + m) \% m$

$$(-3 + 5) \% 5$$

$$\Rightarrow 2 \% 5$$

$$\Rightarrow 2$$

$$= (7 \% 5 - 10 \% 5) \% 5$$

$$= (2 - 0) \% 5$$

$$= 2 \% 5$$

$$= 2$$

$$a = 2, b = 4, m = 5$$

$$= (2 \% 5 - 4 \% 5) \% 5$$

$$= (2 - 4) \% 5$$

$$= -2 \% 5$$

$$(-2 + 5) \% 5$$

$$= 3 \% 5$$

$$= 3$$

$$b) (a^b) \% m = ((a \% m)^b) \% m$$

Eg.

$$20^{120} \% 2 \Rightarrow ((20 \% 2)^{120}) \% 2$$

$$\Rightarrow (0^{120}) \% 2$$

$$\Rightarrow 0 \% 2$$

$$\Rightarrow 0$$

Qviz 1:

$$(37^{\frac{103}{12}} - 1) \div .12 = \frac{(a-b)^{\frac{1}{12} \cdot M}}{(a \cdot M - b \cdot M + M) \cdot M}$$

$$\Rightarrow (37^{\frac{103}{12}} - 1 \cdot .12 + 12) \div .12$$

$$\Rightarrow a^b \cdot M = ((a \cdot M)^b) \cdot M$$

$$\Rightarrow ((37 \cdot .12)^{\frac{103}{12}} - 1 + 12) \div .12$$

$$\Rightarrow ((1)^{\frac{103}{12}} \cdot .12 + 11) \div .12$$

$$\Rightarrow ((1) \cdot .12 + 11) \div .12$$

$$\Rightarrow (1 + 11) \cdot .12$$

$$\Rightarrow 12 \cdot .12 = 0$$

$$\begin{aligned} & (35)^{\frac{103}{12}} \\ &= ((35 \cdot .12)^{\frac{103}{12}}) \cdot .12 \\ &= ((11)^{\frac{103}{12}}) \cdot .12 \quad (11)^5 \end{aligned}$$

$$\hookrightarrow (11 * 11) \cdot .12 \rightarrow 1$$

$$\hookrightarrow (1 * 11) \cdot .12 \rightarrow 11$$

$$\hookrightarrow (11 * 11) \cdot .12 \rightarrow 1$$

$$\hookrightarrow (1 * 11) \cdot .12 \rightarrow 11$$

Qviz 2:

$$(25 + 13) \cdot .7 \Rightarrow (25 \cdot .7 + 13 \cdot .7)$$

$$= (4 + 6) \cdot .7$$

$$= 10 \cdot .7$$

= 3

Q) Count pairs whose sum is multiple of M.

Given an array, find count of pairs (i, j) such that $(arr[i] + arr[j]) \% m = 0$

Note: $i \neq j$

$$A[] = \{4, 3, 6, 3, 8, 12\}, M=6$$

Pairs

$$(4+8)\%6 = 0$$

ans = 3

$$(3+3)\%6 = 0$$

$$(6+12)\%6 = 0$$

Brute force:

- 1) Iterate through all possible pairs
- 2) If remainder is 0, count ++

TC: $O(n^2)$

$$m = 6$$

Optimal Approach: Utilise $(a+b) \times m = (ax.m + by.m) \times m$

$A[] = \{ 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 \}$
 $A[] \% 6 = \{ 2, 3, 4, 2, 0, 3, 5, 0, 5, 1, 0 \}$
 $cnt = 0 \times 2 + 4 \times 6 - 8$

a	b	m	
$a+b = m$	0	6	$(0+0) \times 6 = 0$
$a=2,$	1	5	6
$b = m-a$	2	4	6
$= 6-2$	3	3	6
$= 4$	4	2	6
	5	1	6

$$A[] = \{ 2, 3, 4, 8, 6, 15, 5, 12, 17, 7, 18 \}$$

$$A[] \% 6 = \{ 2, 3, 4, 2, 0, 3, 5, 0, 5, 1, 0 \}$$

$M = 6$

} return count;

Quiz for sc

TC: O(n)

SC: O(m)

Break: 10-35

HCD Basics

HCD - Greatest common divisor

HCF - Highest common factor

$\text{HCD}(A, B) \rightarrow$ Greatest factor that divides both A & B.

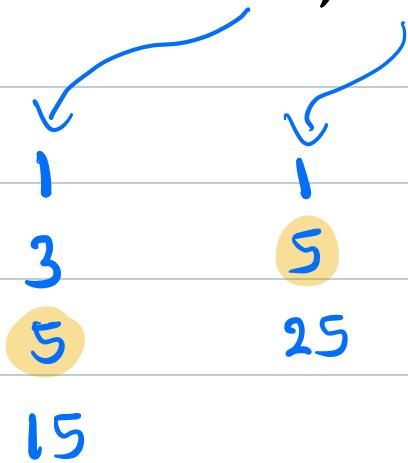

$$\text{HCD}(A, B) = x$$

$$A \times x = 0$$

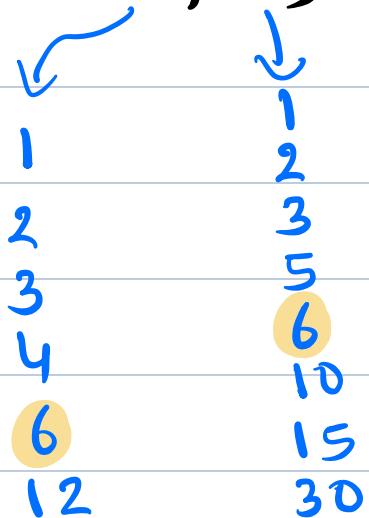

$$B \times x = 0$$

Eg.

$$\text{HCD}(15, 25) = 5$$

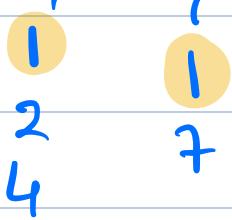

$$\text{HCD}(12, 30) = 6$$

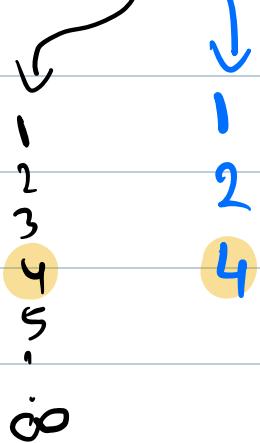

Quiz:

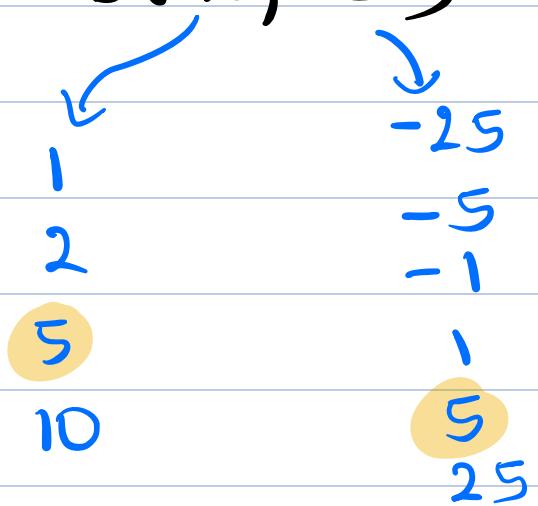

$$\text{GCD}(4, 7)$$

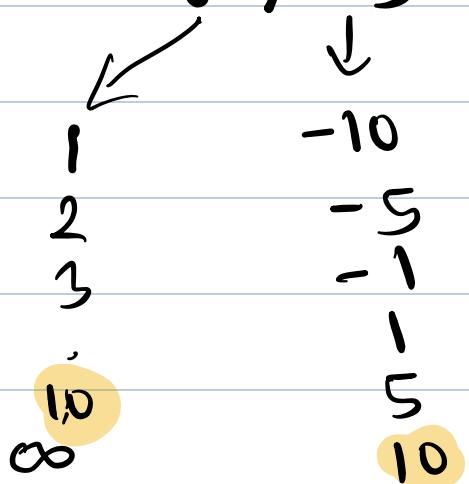

$$\text{GCD}(0, 4) = 4$$

$$\text{GCD}(10, -25) = 5$$

$$\text{GCD}(0, -10) = 10$$

Properties of HCD

$$1) \text{HCD}(A, B) = \text{HCD}(B, A)$$

$$2) \text{HCD}(0, A) = |A|$$

$$\begin{aligned}3) \text{HCD}(A, B) &= \text{HCD}(-A, B) = \text{HCD}(A, -B) \\&= \text{HCD}(-A, -B)\end{aligned}$$

$$\begin{aligned}4) \text{HCD}(A, B, C) &= \text{HCD}(A, \text{HCD}(B, C)) \\&= \text{HCD}(B, \text{HCD}(A, C)) \\&= \text{HCD}(C, \text{HCD}(A, B))\end{aligned}$$

* Special property of HCD

Given $A, B > 0$ and $A \geq B$ and
 $\text{HCD}(A, B) = x$

$$\text{HCD}(A-B, B) = ?$$

$$\text{HCD}(A, B) = x$$

$$\begin{array}{l} \rightarrow A \% x = 0 \\ \rightarrow B \% x = 0 \end{array}$$

$$\text{HCD}(A - B, B) = x$$

$$(A - B \% x) = 0$$

$$B \% x = 0$$

$$= (A \% x - B \% x + x) \% x$$

$$= (0 - 0 + x) \% x$$

$$= x \% x$$

$$= 0$$

$$\begin{array}{c} A \quad B \\ \text{HCD}(23, 5) \Rightarrow \text{HCD}(18, 5) \Rightarrow \text{HCD}(13, 5) \end{array}$$

$$\text{HCD}(8, 5)$$

$$\text{HCD}(3, 5)$$

$$\begin{aligned} \text{HCD}(23, 5) &= \text{HCD}(3, 5) \\ &= \text{HCD}(23 \% 5, 5) \end{aligned}$$

$$\text{HCD}(A, B) = \text{HCD}(A \% B, B)$$

* Quiz : $\text{lcm}(0, 8) \Rightarrow 8$

* Quiz : $A = [15, 21, 33, 45]$, lcm of all elements

Ans = 3

$$\text{lcm}(A, B) \Rightarrow \text{lcm}(18, 5) \Rightarrow \text{lcm}(13, 5)$$

\downarrow

$$\text{lcm}(18, 5)$$

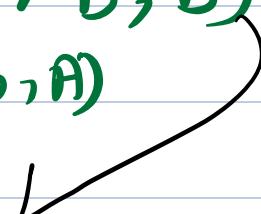

\downarrow

$$\text{lcm}(3, 5)$$

$$\text{lcm}(A, B) = \text{lcm}(B, A)$$

$$\begin{array}{c} \text{GCD}(24, 16) \Rightarrow \text{GCD}(8, 16) \\ \downarrow \\ \text{GCD}(16, 8) \\ \downarrow \\ \text{GCD}(8, 8) \\ \downarrow \\ \text{GCD}(0, 8) \\ \downarrow \\ \text{GCD}(8, 0) \end{array}$$

$$\begin{array}{l} \text{GCD}(A, B) = \text{GCD}(A \% B, B) \\ \text{GCD}(A, B) = \text{GCD}(B, A) \end{array}$$

$$\text{GCD}(A, B) = \text{GCD}(B, A \% B)$$

$$\begin{aligned} \text{GCD}(14, 21) &\Rightarrow \text{GCD}(21, 14) \Rightarrow \text{GCD}(14, 7) \\ &\Rightarrow \text{GCD}(7, 0) \end{aligned}$$

Ans = 7

$a, b > 0$

int gcd(a, b)

d
if ($b == 0$) return a;
return gcd(b, a % b);

gcd(3, 7) \rightarrow gcd(7, 3) \rightarrow gcd(3, 1)
 \downarrow
gcd(1, 0)

TC: $O(\log \min(a, b))$
SC: $O(\log \min(a, b))$

Ans = 1

* Given an array of N elements, you have to delete one element such that HCD of remaining elements become maximum.

$$A[] = \{ 24, 16, 18, 30, 15 \}$$

HCD

$$\{ 24, 16, 18, 30, 15 \} \rightarrow \text{Ans} = 1$$

$$\{ 24, 16, 18, 30, 15 \} \rightarrow \text{Ans} = 3$$

$$\{ 24, 16, 18, 30, 15 \} \rightarrow \text{Ans} = 1$$

$$\{ 24, 16, 18, 30, 15 \} \rightarrow \text{Ans} = 1$$

$$\{ 24, 16, 18, 30, 15 \} \rightarrow \text{Ans} = 2$$

Qn12

$$\{ \cancel{21}, 7, 2, 14 \} \rightarrow 1$$

$$\{ 21, \cancel{7}, 2, 14 \} \rightarrow 1$$

$$\{ 21, 7, \cancel{2}, 14 \} \rightarrow 7$$

$$\{ 21, 7, 2, \cancel{14} \} \rightarrow 1$$

Bruteforce: Delete an element and calculate max for all the elements which maintaining max. \rightarrow repeat for all the elements.

TC: $O(N^2 * \log(\min \text{ of array}))$
